ENGR 121  Homework 9

1. Using the Internet and any other sources, learn about the world’s supply of non-renewable energy (oil, gas, coal, other). Consider implications of your findings on environmental sustainability, quality of life, the economy and the engineering profession. Write up a paragraph in your own words describing what you have learned; be thinking about how the topic of energy could impact your career. **We expect you to spend about one half hour completing this problem; this is not meant to be an exhaustive study of the topic.**

2. **Team Assignment:** If your instructor has not already evaluated your conductivity control system, then please bring homework 8 to the next class (or an updated version of homework 8). Your instructor will use this document to record the performance of your system.
